

Lead Software Engineer

10 Fitness & 365 Member Access

Reports to: CIO

Location: Maumelle, Arkansas

Employment Type: Full-Time

On-Call: Rotation Required

Position Summary

The Lead Software Engineer is the hands-on technical leader responsible for the software systems supporting 365 Member Access and 10 Fitness. This position combines software development with technical leadership, architecture, production support, mentoring, and project ownership.

The Lead Software Engineer works closely with the CIO to translate business priorities into practical technical plans and ensure engineering initiatives move from concept through successful production deployment.

The highest operational priority of this role is the reliability, security, and continued development of the customer-facing 365 Member Access platform, including its cloud services, integrations, Android kiosks, and connected hardware.

Core Responsibilities

Engineering Leadership

Lead and mentor software engineers while remaining actively involved in development and troubleshooting. Establish and maintain appropriate standards for architecture, code quality, testing, security, deployment, documentation, and source control.

Conduct code reviews, provide technical guidance, identify skill gaps, and reduce unnecessary dependencies on any single team member.

Project Ownership and Visibility

Own assigned engineering initiatives from planning through completion.

Maintain clear visibility into active work by communicating:

- Current priorities and status
- Expected milestones and timelines
- Technical dependencies
- Known risks and blockers
- Changes in scope or estimates
- Decisions or resources needed from leadership

Proactively escalate issues when progress is at risk rather than allowing projects or technical problems to remain stalled without visibility.

Technical Planning and CIO Partnership

Work with the CIO to translate business needs into technical requirements, estimates, milestones, and implementation plans.

Provide evidence-based recommendations regarding technical feasibility, architecture, risk, cost, timelines, and alternatives. Technical disagreement is encouraged when supported by thoughtful analysis and evidence.

Once priorities and technical direction are established, support the agreed plan and execute it professionally.

365 Member Access Platform

Maintain technical ownership of the systems supporting 365 Member Access, including:

- Member synchronization and credential validation
- Access-control decisions and schedules
- Door and amenity control
- Partner and administrative tools
- Notifications and reporting
- Customer-facing applications and services

Customer-impacting defects should receive appropriate urgency, investigation, ownership, and follow-through.

Cloud Backend and Integrations

Lead the design, development, and operation of cloud-based services and APIs across development, staging, and production environments.

Maintain reliable and secure integrations with systems such as ABC Fitness, Daxko, Hapana, Zenoti, Club Automation, and other third-party platforms.

Responsibilities include appropriate oversight of cloud architecture, data storage, serverless workflows, access controls, monitoring, backup and recovery, Infrastructure as Code, and cloud operating costs.

Android and Hardware Integration

Lead development and support of the Android applications used by 365 Member Access kiosks and connected devices.

Troubleshoot software and hardware integration issues involving QR, barcode and NFC readers, relays, networking, peripherals, firmware, device communication, memory management, application stability, and software updates.

Maintain secure application signing, deployment, and device-update procedures.

Production Reliability Security and Quality

Help ensure production systems are reliable, recoverable, secure, and supportable.

Lead or assist with:

- Production incident response
- Root-cause analysis
- Monitoring and alerting
- CI/CD processes
- Automated testing
- Secure development practices
- Production change controls
- Backup, rollback, and recovery procedures

Recurring problems should be investigated to their underlying cause when practical rather than repeatedly addressed only at the symptom level.

Documentation Cross Training and Innovation

Maintain appropriate technical documentation, architecture information, deployment procedures, and operational runbooks.

Cross-train engineers on critical systems and reduce single-person dependencies by ensuring others can support important production functions.

Evaluate new technologies, hardware, APIs, and development approaches through practical research and bounded proofs of concept. Support responsible use of AI-assisted development and AI-based features with appropriate independent review and testing.

Technical Environment

The Lead Software Engineer should be comfortable working across a modern cloud and application-development environment that currently includes technologies such as:

Application Development

TypeScript/JavaScript, Node.js, React/Next.js, REST/JSON, GraphQL/AppSync, Android Java/Kotlin

AWS and DevOps

AWS Lambda, API Gateway, DynamoDB, Cognito, SQS/SNS, SES, EventBridge, Step Functions, Amplify, CloudWatch, CDK/CloudFormation, GitHub and CI/CD

Engineering Practices

Distributed and event-driven systems, third-party APIs, automated testing, observability, incident response, Infrastructure as Code, secure development, and AI-assisted development

The technology environment will continue to evolve, and experience with every listed technology is not required.

Required Qualifications

- Approximately 7+ years of professional software engineering experience or equivalent demonstrated expertise.
- Prior experience acting as a technical lead, senior engineer, mentor, or technical owner of significant systems.
- Strong TypeScript/JavaScript and Node.js development skills.
- Significant experience designing, building, and operating production applications on AWS or another major cloud platform.
- Experience with APIs, third-party integrations, CI/CD, source control, automated testing, Infrastructure as Code, and secure software development.
- Strong troubleshooting and root-cause analysis skills.
- Ability to distinguish confirmed facts from assumptions and hypotheses during technical investigations.
- Ability to communicate technical issues, risks, estimates, and recommendations clearly to both technical and nontechnical stakeholders.
- Demonstrated ability to lead, mentor, document, collaborate, and balance technical quality with customer impact, cost, timeline, and business priorities.

Preferred Qualifications

- Production Android development experience using Java or Kotlin.
- Experience with Android memory management, threading, networking, peripherals, or kiosk/device applications.
- Hands-on experience with AWS serverless and event-driven architectures.
- Experience supporting access-control, IoT, fitness-industry, or other hardware-integrated systems.
- Experience taking ownership of an established production codebase.
- Experience transferring institutional knowledge and reducing single-person technical dependencies.
- Experience with production AI/LLM applications or AI-assisted software development.

Leadership and Performance Expectations

Success in this position will be measured by more than the amount of software produced.

The Lead Software Engineer is expected to demonstrate:

- Reliable and stable customer-facing systems
- Appropriate urgency and ownership during production incidents
- Predictable progress on engineering priorities
- Proactive communication of status, risks, blockers, and changing estimates
- Sound technical judgment supported by investigation and evidence
- Maintainable, secure, and appropriately tested software
- Effective mentoring and development of other engineers
- Useful documentation and knowledge sharing
- Reduced single-person dependencies
- Professional and respectful communication, including during technical disagreement

The Lead Software Engineer should be hands-on, accountable, thorough, security-conscious, calm under pressure, and committed to the success of both the engineering team and the business.

Education and Work Environment

A bachelor's degree in Computer Science, Software Engineering, Computer Engineering, Information Systems, or a related field is preferred. Equivalent professional experience may be accepted.

This position is primarily office and computer based but may occasionally involve access-control or kiosk hardware, travel, participation in an engineering on-call rotation, and lifting equipment weighing up to approximately 50 pounds.

Job Description Acknowledgment

This job description summarizes the general nature and level of work expected of the Lead Software Engineer. It is not intended to identify every responsibility, technology, project, or circumstance associated with the position. Responsibilities may evolve as company, customer, and technology needs change.

I have reviewed this job description, understand the duties and responsibilities expected of the position, and have had an opportunity to ask questions.
